

RMA 3000 Remote Meter Assemblies Specifications

34-ST-03-81 May 2011

Introduction

Overview

The Remote Meter Assembly RMA 3000 functions as an output and status indicator for a compatible Honeywell Smartline Transmitter or as an output indicator for a non-Honeywell transmitter operating in a 4-20mA current loop. The RMA 3000 consists of a meter mounted in an aluminum explosion-proof housing with several protective paint styles available.

Four meter types are available for mounting in the RMA 3000 housing:

- the **Smart Meter (SM)**,
- the **Digital Meter (DM)**,
- the **Analog Meter (ME)**, and
- the **Engineering Unit Display Meter (EU)**

The **Smart Meter SM** can be used to display either output in % or engineering units appropriate to the transmitter depending on the transmitter type and configuration. The SM can be used with any one of the following Smartline Transmitters in either analog or DE mode: ST 3000 Smart Pressure Transmitter, or the STT 3000 Smart Temperature Transmitter

The **Digital Meter DM** is used exclusively with Honeywell transmitters operating in the DE (Digital Enhanced) mode. The DM features a fan style 25 segment bargraph with digital indication and status displays. The DM digital indicator gives precise output of the transmitter from -199.9 to +199.9% of transmitter range. Engineering units are not available on the DM.

The **Analog Meter ME** is used with analog output transmitters to give % output using a needle-type meter movement.

The **Engineering Units Meter EU** provides digital display of temperature, pressure, level, flow, or other measurements in real Engineering Units. This meter provides a universal solution for 4-20mA measurement displays by converting any 4-20mA signal into an LCD digital display in the preferred engineering units.

The EU Display Meter is available for remote-mount field use or can be integrally mounted in the STT250 Temperature Transmitters or in the STT250 Model STT25H with the HART™ protocol.

Features and Functions

RMA300 - SM

The Smart Meter (SM) is a digital device that functions as an output and status indicator for a compatible Honeywell Smartline Transmitter, or just as an output indicator for a non-Honeywell transmitter operating in a 4 to 20 mA current loop. It can operate in the analog mode (4-20 mA), or can operate in the Honeywell proprietary Digital Enhanced (DE) mode.

As indicated in the illustration, the SM is similar in appearance to the DM. That is, they both have a multi-segment fan-style bargraph that indicates from 0% to 100%, and both include status indicators. However, the SM can be easily distinguished from the DM in that the SM has:

- 17-segment bargraph (compared to 25 for the DM) more status indicators than the DM
- Three wire connections (Red, Blue, and Yellow) to other components whereas the DM has two wire connections (Red and Yellow).
- The SM has a configuration button on the periphery of the case at lower left.

RMA300 - DM

Designed for use with Honeywell smart transmitters operating in the Digital (DE) Communications Mode, the DE Meter provides convenient, easy-to-read transmitter output and loop status indications on its liquid-crystal display. As shown in the figure, the DE Meter display features a 25-segment bargraph, a digital readout, and a set of status messages.

The 25-segment bargraph gives a gross indication of transmitter output from 0 to 100% that can be viewed from up to 30 feet away. The digital readout, a complement to the bargraph indication, gives a precise indication of transmitter output from -199.9 to +199.9% that can be read from up to 10 feet away.

Status messages serve as online diagnostics for various detectable loop conditions. When the transmitter is in the square root mode, the DE Meter still displays the transmitter output from 0 to 100%. The DE Meter has no square root mode or flow indicator display.

RMA300 - ME

Function - The ME is an analog device that functions as an output indicator for any transmitter that operates in the 4-20 mA current mode.

Application - The ME can be used as a Remote Meter Assembly component with any one of the following Smartline Transmitters operating in the analog (4 to 20 mA) mode.

Electrical Characteristics – The ME is an electromechanical device of the D'Arsonval type. That is, the current passing through a coil in the meter is used to deflect a needle to indicate the magnitude of the current, where a current of 4-20 mA represents 0% to 100%.

The ME can be used in combination with the SM in the same loop, provided that the formula presented under the SM description above in electrical characteristics for multiple meters is obeyed.

RMA300 - EU

The EU Display Meter is connected in series with the 4-20mA loop and is powered by the loop power. It operates by processing the 4-20mA signal via an analog-to-digital converter and scaling the digital measurement linearly into the desired operating range, which the user configures into the meter. The LCD display includes a selection of integral engineering units for temperature and pressure applications (for example - °C, °F, in H₂O, psi, etc. and a "K" multiplier that can be included when larger ranges require it).

The EU Display Meter also includes a bar-graph display of measured signal as a percentage of the 16mA signal span. This enables confirmation from some distance away that the measurement loop is operating satisfactorily or that attention is required. The meter is configured by an integral selection switch, which enables setting the Low (4mA) and High (20mA) display range limits.

* See ATEX installation requirements in the Operator's Manual

**The user must determine the type of protection required for installation of the equipment. The user shall then check the box [✓] adjacent to the type of protection used on the equipment certification nameplate. Once a type of protection has been checked on the nameplate, subsequently the equipment shall not be reinstalled using any of the other certification types.
